

Damaging surface hail in simulations of satellite-detected hailstorms in Australia's tropics: supplementary material

Figure 1: As for main Figure 3, but with the full y-axis range.

Figure 2: As for main Figure 4 but with classes categorised by whether the simulation produced damaging surface hail according to the microphysics schemes, and with hail size as calculated by the microphysics scheme. P3-3M is not shown because it does not provide near-surface hail diameters.

Figure 3: As for main Figure 5 but with profiles categorised by whether the simulation produced damaging surface hail according to the microphysics scheme. P3-3M is not shown because it does not provide near-surface hail diameters.

Figure 4: As for main Figure 6 but with profiles categorised by whether the simulation produced damaging surface hail according to the microphysics scheme. P3-3M is not shown because it does not provide near-surface hail diameters.

Figure 5: As for main Figure 7 but with profiles categorised by whether the simulation produced damaging surface hail according to the microphysics scheme. P3-3M is not shown because it does not provide near-surface hail diameters.
